

Primary roles of web designers are crafting the visual and user experience of a website by conceptualizing aesthetic and functional layout sites, defining color, typography, logos etc.

Main responsibilities of a dev Web are to transform design concepts into functional websites by writing clean efficient code, implementing design blueprints and creating interactive and responsive web experiences.

Web designers might create logos and Multimedia content but also infographics.

Basic languages that are typically used by web developers are HTML, CSS, Javascript and frameworks.

The important distinction between web design and web developers is one creating visuals of the website by wireframe and the other one is writing code by referring to this wireframe.

Having the skills of a Web designer and Web developer is advantageous because you can create functional and visually beautiful web sites by yourself.
